

Homework 13

Circom

Complete the circom exercises in the [repo](#), following the instructions in the README.md files.

You can use the repl tool [zkREPL](#),

Stark Theory

1. Imagine you get the following trace

0,2,4,6,8,10,12

from your program (which simply adds 2 to the previous value.)

Write out the constraints for this trace, in terms of i, j

2. Polynomial practice

for

$$p(x) = x^3 - 5x^2 - 4x + 20$$

a) find an integer root a , i.e. $p(a) = 0$ (clue < 7)

b) write this in terms of a lower degree polynomial $q(x)$

such as $p(x) = (x - a)q(x)$

What are the degrees of $p(x)$ and $q(x)$?

Note we are doing this over the real numbers, for zkps we would use a finite field
